

FL-01: AI Workflow Audit

Name: Aqif Mohammed Kamil / Aqifcodes

Date: September 30, 2026

Track: AI Fluency (FL-01)

Repository: <https://github.com/Aqifcodes/flyrank-ml-internship>

1. Task Audit Table

#	Task Description	Classification	One-Line Rationale
1	Designing core ML model architecture trade-offs	Just me	Critical architectural decisions require deep personal context and domain judgement.
2	Final decision on project roadmap & priorities	Just me	High-stakes strategy and personal accountability cannot be outsourced to AI.
3	Writing Python boilerplate for FastAPI endpoints	Fully automate	Standard REST boilerplate follows repetitive patterns easily generated by scripts/LLMs.

4	Drafting SQL queries for database aggregation	Collaborate with AI	AI rapidly drafts initial queries, while I refine joins and verify window function accuracy.
5	Debugging complex Python runtime stack traces	Delegate to AI with review	AI identifies error causes fast, but I must review fixes to prevent side effects.
6	Summarizing long technical documentation & whitepapers	Delegate to AI with review	AI extracts core points quickly; I review against source text to spot missing details.
7	Generating synthetic test datasets for Pandas testing	Fully automate	Deterministic rule-based data generation is fully automatable via scripts or AI.
8	Formatting Markdown presentation decks and charts	Delegate to AI with review	AI handles layout structuring, but I review formatting to match project aesthetics.
9	Writing unit tests for backend API routes	Delegate to AI with review	AI generates edge-case test suites, but I verify coverage and assertions manually.

10	Refactoring complex Pandas DataFrame operations	Collaborate with AI	AI suggests vectorized alternatives, and we iteratively optimize for memory and speed.
11	Drafting weekly status reports for project assignments	Delegate to AI with review	AI structures bullet points into clear updates, which I review for accuracy before submission.
12	Conducting final code reviews before main branch merges	Just me	Human inspection ensures security, logic sanity, and repo quality standards.

2. Tool Setup & Verification

Anthropic Academy Enrollment

Configured Claude Project

3. Selected Target Tasks & Success Definitions

Task 1: Debugging complex Python runtime stack traces

- **Classification:** Delegate to AI with review
- **"Done Well" Definition:**
 - The root cause of the bug is correctly identified within 2 minutes.
 - The proposed fix solves the error without introducing new regressions or breaking dependencies.
 - Code remains clean and fully compliant with project style guidelines.

Task 2: Refactoring Pandas DataFrame operations for efficiency

- **Classification:** Collaborate with AI
- **"Done Well" Definition:**
 - Memory footprint and execution speed improve by at least 20% over baseline.
 - Explicit vectorization replaces slow `for` loops or `apply()` statements.
 - Output values remain 100% identical to the original implementation when tested against unit cases.

Task 3: Drafting unit test suites for FastAPI backend endpoints

- **Classification:** Delegate to AI with review
- **"Done Well" Definition:**
 - Test suite covers both standard 200 OK responses and 4xx/5xx edge cases.
 - Tests run clean via `pytest` without requiring manual mock adjustments.
 - Overall test coverage increases by at least 30%.
